

Fabricating better skills for the manufacturing industry

The World Economic Forum identified skills gaps in local labour markets as a main barrier to the adoption of new technologies in manufacturing. It predicted in 2020 that 40% of core skills will change within five years, putting pressure on manufacturing companies to reskill or upskill employees fast. The DiSTT project improves local skills in digital fabrication through innovative re- and upskilling programmes. Based on their tailored pilots, the partners create a new toolkit for the transformation of digital skills. The kit will include scalable guidance that can be transferred to fabrication labs or training organisations across Europe.
