Reducing the energy consumption of transport systematically

Transport remains a huge consumer of energy in central European countries. It is still highly dependent on fossil fuels and produces enormous emissions. Partners in the REDU-CE-D project work together to increase efficiency of different modes of transportation by transposing the European energy directive. They develop and disseminate a customized environmental management system based on EU requirements and a joint strategy. In this process, they involve stakeholders in testing and training activities, as well as in advocacy efforts for policy adoption.
